

电磁波的辐射

(第一次修订)

1. 规范变换

[电磁场的势] $\vec{E} = -\vec{\nabla}\varphi - \frac{\partial \vec{A}}{\partial t}$.

[规范不唯一的证明]

设 ψ 为任意时空函数, 作规范变换: $\begin{cases} \vec{A} \rightarrow \vec{A}' = \vec{A} + \vec{\nabla}\psi \\ \varphi \rightarrow \varphi' = \varphi - \frac{\partial\psi}{\partial t} \end{cases}$

此时 $\begin{cases} \vec{B}' = \vec{\nabla} \times \vec{A}' = \vec{\nabla} \times \vec{A} + \vec{\nabla} \times \vec{\nabla}\psi = \vec{\nabla} \times \vec{A} = \vec{B} \\ \vec{E}' = -\vec{\nabla}\varphi' - \frac{\partial \vec{A}'}{\partial t} = -\vec{\nabla}\varphi + \frac{\partial \vec{\nabla}\psi}{\partial t} - \frac{\partial \vec{A}}{\partial t} - \frac{\partial \vec{\nabla}\psi}{\partial t} = -\vec{\nabla}\varphi - \frac{\partial \vec{A}}{\partial t} = \vec{E} \end{cases}$

[规范变换与规范不变性] 当势作规范变换时, 所有物理量与物理规律都应该保持不变. 这种不变性称为规范不变性.

[规范条件]

库伦规范: $\vec{\nabla} \cdot \vec{A} = 0$;

洛伦兹规范: $\vec{\nabla} \cdot \vec{A} + \frac{1}{c^2} \frac{\partial \varphi}{\partial t} = 0$.

2. 电磁场的势

[真空中电磁场势的基本方程] $\begin{cases} \vec{\nabla}^2 \vec{A} - \frac{1}{c^2} \frac{\partial^2 \vec{A}}{\partial t^2} - \vec{\nabla}(\vec{\nabla} \cdot \vec{A} + \frac{1}{c^2} \frac{\partial \varphi}{\partial t}) = -\mu_0 \vec{J} \\ \vec{\nabla}^2 \varphi + \frac{\partial}{\partial t} \vec{\nabla} \cdot \vec{A} = -\frac{\rho}{\epsilon_0} \end{cases}$

采用库伦规范: $\begin{cases} \vec{\nabla}^2 \vec{A} - \frac{1}{c^2} \frac{\partial^2 \vec{A}}{\partial t^2} - \frac{1}{c^2} \frac{\partial \varphi}{\partial t} = -\mu_0 \vec{J} \\ \vec{\nabla}^2 \varphi = -\frac{\rho}{\epsilon_0} \end{cases}$;

采用洛伦兹规范: $\begin{cases} \vec{\nabla}^2 \vec{A} - \frac{1}{c^2} \frac{\partial^2 \vec{A}}{\partial t^2} = -\mu_0 \vec{J} \\ \vec{\nabla}^2 \varphi - \frac{1}{c^2} \frac{\partial^2 \varphi}{\partial t^2} = -\frac{\rho}{\epsilon_0} \end{cases}$.

[达朗贝尔方程] 电荷产生标势波动, 电流产生矢势波动.

$\begin{cases} \vec{\nabla}^2 \vec{A} - \frac{1}{c^2} \frac{\partial^2 \vec{A}}{\partial t^2} = -\mu_0 \vec{J} \\ \vec{\nabla}^2 \varphi - \frac{1}{c^2} \frac{\partial^2 \varphi}{\partial t^2} = -\frac{\rho}{\epsilon_0} \\ \vec{\nabla} \cdot \vec{A} + \frac{1}{c^2} \frac{\partial \varphi}{\partial t} = 0 \end{cases}$

[推迟势 (达朗贝尔方程的解)] $\begin{cases} \varphi(\vec{x}, t) = \frac{1}{4\pi\epsilon_0} \int_V \frac{\rho(\vec{x}', t - \frac{r}{c})}{r} dV' \\ \vec{A}(\vec{x}, t) = \frac{\mu_0}{4\pi} \int_V \frac{\vec{J}(\vec{x}', t - \frac{r}{c})}{t} dV' \end{cases}$

[推迟势的推导]

先求只在原点存在点电荷的情形. 由 $\vec{\nabla}^2 \varphi - \frac{1}{c^2} \frac{\partial^2 \varphi}{\partial t^2} = -\frac{\rho}{\varepsilon_0}$, 得 $\vec{\nabla}^2 \varphi - \frac{1}{c^2} \frac{\partial^2 \varphi}{\partial t^2} = -\frac{1}{\varepsilon_0} Q(t) \delta(\vec{x})$.

因点电荷激发的势具有球对称性, 所以 $\vec{\nabla} \varphi = \frac{\partial \varphi}{\partial r}, \vec{\nabla} \cdot \vec{\nabla} \varphi = \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial r} (r^2 \sin \theta \frac{\partial \varphi}{\partial r}) = \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 \frac{\partial \varphi}{\partial t})$

$$\text{即: } \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 \frac{\partial \varphi}{\partial r}) - \frac{1}{c^2} \frac{\partial^2 \varphi}{\partial t^2} = -\frac{1}{\varepsilon_0} Q(t) \delta(\vec{x}).$$

除原点外空间均无源, 有 $\frac{1}{r^2} \frac{\partial}{\partial r} (r^2 \frac{\partial \varphi}{\partial r}) - \frac{1}{c^2} \frac{\partial^2 \varphi}{\partial t^2} = 0$.

因 φ 随 r 增大而减弱, 可以设 $\varphi(r, t) = \frac{u(r, t)}{r}$, 即 $\frac{\partial^2 u}{\partial r^2} - \frac{1}{c^2} \frac{\partial^2 \varphi}{\partial t^2} = 0$.

分离变量解 $u(r, t) = R(r)T(t)$, 得 $T \frac{\partial^2 R}{\partial r^2} - \frac{1}{c^2} R \frac{\partial^2 T}{\partial t^2} = 0$.

$$\text{令 } \frac{1}{R} \frac{\partial^2 R}{\partial r^2} = \frac{1}{c^2} \frac{1}{T} \frac{\partial^2 T}{\partial t^2} = -\lambda, \text{ 得 } \begin{cases} \frac{\partial^2 R}{\partial r^2} + \lambda R = 0 \\ \frac{\partial^2 T}{\partial t^2} + c^2 \lambda T = 0 \end{cases}$$

$$\text{解得: } \begin{cases} R(r) = C_1 e^{i\sqrt{\lambda}r} + D_1 e^{-i\sqrt{\lambda}r} \\ T(t) = C_2 e^{ic\sqrt{\lambda}t} + D_2 e^{-ic\sqrt{\lambda}t} \end{cases}$$

解得 $u(r, t) = R(r)T(t) = A_1 e^{ic\sqrt{\lambda}(t-\frac{r}{c})} + A_2 e^{-ic\sqrt{\lambda}(t-\frac{r}{c})} + B_1 e^{ic\sqrt{\lambda}(t+\frac{r}{c})} + B_2 e^{-ic\sqrt{\lambda}(t+\frac{r}{c})}$

$$\text{设 } \begin{cases} f(t - \frac{r}{c}) = A_1 e^{ic\sqrt{\lambda}(t-\frac{r}{c})} + A_2 e^{-ic\sqrt{\lambda}(t-\frac{r}{c})} \\ g(t + \frac{r}{c}) = B_1 e^{ic\sqrt{\lambda}(t+\frac{r}{c})} + B_2 e^{-ic\sqrt{\lambda}(t+\frac{r}{c})} \end{cases}, \text{ 得 } u(r, t) = f(t - \frac{r}{c}) + g(t - \frac{r}{c}).$$

在 $g(t + \frac{r}{c})$ 中, t 随 r 的增大而减小, 表示电磁波向内收敛. 在辐射问题中应有 $B_1 = B_2 = g(t - \frac{r}{c}) = 0$, 所以 $u(r, t) = f(t - \frac{r}{c})$, 即 $\varphi(r, t) = \frac{1}{r} f(t - \frac{r}{c})$.

与静电情形 $\varphi(r) = \frac{Q}{4\pi\varepsilon_0 r}$ 比较可以猜解: $\varphi(r, t) = \frac{Q(t - \frac{r}{c})}{4\pi\varepsilon_0 r}$.

为了验证此解成立, 作 $r = \eta \rightarrow 0$ 的球面, 应有:

$$\int_0^\eta 4\pi r^2 dr \left(\vec{\nabla}^2 - \frac{1}{c^2} \frac{\partial^2}{\partial t^2} \right) \varphi = \int_0^\eta 4\pi r^2 dr \left[-\frac{Q(t - \frac{r}{c})}{\varepsilon_0} \delta(\vec{x}) \right].$$

此时, $\frac{1}{c^2} \frac{\partial^2}{\partial t^2} \varphi \sim \eta \rightarrow 0, t - \frac{r}{c} \rightarrow t$.

$$\text{左式} \rightarrow \frac{Q(t)}{4\pi\varepsilon_0} \int_V dV \vec{\nabla}^2 \frac{1}{r} = \frac{Q(t)}{4\pi\varepsilon_0} \oint_S \vec{\nabla} \frac{1}{r} \cdot d\vec{S} = -\frac{Q(t)}{\varepsilon_0}$$

$$\text{右式} = \int_V -\frac{Q(t)}{\varepsilon_0} \delta(\vec{x}) dV = -\frac{Q(t)}{\varepsilon_0}$$

所以 $\varphi(r, t) = \frac{Q(t - \frac{r}{c})}{4\pi\varepsilon_0 r}$ 是可行解, 当点电荷位于任意位置时: $\varphi(\vec{x}, t) = \frac{Q(\vec{x}', t - \frac{r}{c})}{4\pi\varepsilon_0 r}$

对于一般的电荷分布 $\rho(\vec{x}', t)$, 有 $\varphi(\vec{x}, t) = \frac{1}{4\pi\varepsilon_0} \int_V \frac{\rho(\vec{x}', t - \frac{r}{c})}{r} dV'$;

矢势 \vec{A} 具有相同形式, 故 $\vec{A}(\vec{x}, t) = \frac{\mu_0}{4\pi} \int_V \frac{\vec{J}(\vec{x}', t - \frac{r}{c})}{r} dV'$.

[推迟势的意义] 空间某点 \vec{x} 在时刻 t 的场值不依赖于同一时刻的电荷电流分布, 而是决定于较早时刻 $t - \frac{r}{c}$ 的电荷电流分布. 反映了电磁作用具有一定的传播速度.

3. 电偶极辐射

[计算辐射场的一般公式]

已知 $\vec{J}(\vec{x}', t - \frac{r}{c})$ 时, 有 $\vec{A}(\vec{x}, t) = \frac{\mu_0}{4\pi} \int_V \frac{\vec{J}(\vec{x}', t - \frac{r}{c})}{r} dV'$

设 $\vec{J}(\vec{x}', t) = \vec{J}(\vec{x}')e^{-i\omega t}$, 即 $\vec{J}(\vec{x}', t) = \vec{J}(\vec{x}')e^{i(\frac{\omega}{c}r - \omega t)} = \vec{J}(\vec{x}')e^{i(kr - \omega t)}$

则 $\vec{A}(\vec{x}, t) = \frac{\mu_0}{4\pi} \int_V \frac{\vec{J}(\vec{x}')e^{i(kr - \omega t)}}{r} dV' = \frac{\mu_0 e^{-i\omega t}}{4\pi} \int_V \frac{\vec{J}(\vec{x}')e^{ikr}}{r} dV'$

设 $\vec{A}(\vec{x}, t) = \vec{A}(\vec{x})e^{-i\omega t}$, 则 $\vec{A}(\vec{x}) = \frac{\mu_0}{4\pi} \int_V \frac{\vec{J}(\vec{x}')e^{ikr}}{r} dV'$

设电荷密度为 $\rho(\vec{x}, t) = \rho(\vec{x})e^{-i\omega t}$

由电流连续性 $\vec{\nabla} \cdot \vec{J} + \frac{\partial \rho}{\partial t} = 0$ 得 $\vec{\nabla} \cdot \vec{J} = i\omega\rho$

由 $\vec{B} = \vec{\nabla} \times \vec{A}$ 可得磁场 \vec{B} .

由 $\vec{\nabla} \times \vec{B} = \mu_0 \epsilon_0 \frac{\partial \vec{E}}{\partial t} = -\frac{i\omega}{c^2} \vec{E}$ 可得电场 $\vec{E} = \frac{ic}{k} \vec{\nabla} \times \vec{B}$.

[推迟作用因子] e^{ikr} , 表示电磁波传至场点时有 kr 相位滞后.

[矢势的三个线度]

(1). 电荷分布区域线度: l ;

(2). 波长线度: $\lambda = \frac{2\pi}{k}$;

(3). 电荷到场点的距离线度: r .

[小区域条件] $l \ll r, l \ll \lambda$.

[近区 ($r \ll \lambda$) 场的特点] 近区内 $kr \ll 1$, 推迟因子 $e^{kr} \sim 1$, 场保持恒定场的主要特点. 即电场具有静电场的纵向形式, 磁场也与恒定磁场相似.

[矢势对远区 ($r \gg \lambda$) 的展开]

选原点在电荷分布区域内, 则 $|\vec{x}'|$ 的数量级为 l . 用 R 表示原点到场点 \vec{x} 的距离 ($R = |\vec{x}|$), r 为由源点 \vec{x}' 到场点 \vec{x} 的距离, 有:

$$r \approx R - \vec{e}_R \cdot \vec{x}'$$

由 $\vec{A}(\vec{x}) = \frac{\mu_0}{4\pi} \int_V \frac{\vec{J}(\vec{x}')e^{ikr}}{r} dV'$ 得 $\vec{A}(\vec{x}) = \frac{\mu_0}{4\pi} \int_V \frac{\vec{J}(\vec{x}')e^{ik(R - \vec{e}_R \cdot \vec{x}')} dV'}{R - \vec{e}_R \cdot \vec{x}'}$

计算远场时, 只保留 $\frac{1}{R}$ 最低级项, 对 $\frac{1}{\lambda}$ 保留各级项.

由 $k = \frac{2\pi}{\lambda}$ 得 $\vec{A}(\vec{x}) = \frac{\mu_0}{4\pi} \int_V \frac{\vec{J}(\vec{x}')e^{i\frac{2\pi}{\lambda}(R - \vec{e}_R \cdot \vec{x}')}}{R} dV' = \frac{\mu_0 e^{ikR}}{4\pi R} \int_V \vec{J}(\vec{x}')e^{-ik\vec{e}_R \cdot \vec{x}'} dV'$.

对相因子展开 $\vec{A}(\vec{x}) = \frac{\mu_0 e^{ikR}}{4\pi R} \int_V \vec{J}(\vec{x}')(1 - ik\vec{e}_R \cdot \vec{x}' + \dots) dV'$.

[电偶极辐射]

考虑矢势展开的第一项 $\vec{A}(\vec{x}) = \frac{\mu_0 e^{ikR}}{4\pi R} \int_V \vec{J}(\vec{x}') dV'$

设单位体积内有 n_i 个带电 q_i 且速度为 v_i 的粒子, 则单位体积内粒子对电流密度的贡献为: $n_i q_i v_i$, 有 $\vec{J} = \sum_i n_i q_i \vec{v}_i$.

则粒子对电流的总贡献为: $\int_V \vec{J}(\vec{x}') dV' = \sum q \vec{v}$

因 $\sum q \vec{v} = \frac{d}{dt} \sum q \vec{x} = \frac{d \vec{p}}{dt} = \dot{\vec{p}}$, 所以 $\int_V \vec{J}(\vec{x}') dV' = \dot{\vec{p}}$.

对电偶极系统, $\vec{p} = Q \Delta \vec{l}$, $\dot{\vec{p}} = \frac{d \vec{p}}{dt} = \frac{dQ}{dt} \Delta \vec{l} = I \Delta \vec{l} = \int_V \vec{J}(\vec{x}') dV'$

则电偶极辐射 $\vec{A}(\vec{x}) = \frac{\mu_0 e^{ikR}}{4\pi R} \dot{\vec{p}}$.

因展开式只保留 $\frac{1}{R}$ 的最低级项, $\vec{\nabla}$ 不须作用在 $\frac{1}{R}$ 上, 有 $\vec{B} = \vec{\nabla} \times \vec{A} = \frac{\mu_0 i k \vec{e}_R}{4\pi R} e^{ikR} \times \dot{\vec{p}}$.

由 $\ddot{\vec{p}} = -i\omega \dot{\vec{p}}$, 有 $\dot{\vec{p}} = \frac{i}{\omega} \ddot{\vec{p}}$, 即 $\vec{B} = \frac{e^{ikR}}{4\pi \epsilon_0 c^3 R} (\ddot{\vec{p}} \times \vec{e}_R)$.

由 $\vec{E} = \frac{ic^2}{\omega} \vec{\nabla} \times \vec{B}$ 得 $\vec{E} = \frac{e^{ikR}}{4\pi \epsilon_0 c^2 R} (\ddot{\vec{p}} \times \vec{e}_R) \times \vec{e}_R$.

在球坐标系中, 选 \vec{p} 的方向为极轴方向, 则:

$$\begin{cases} \vec{B} = \frac{\ddot{p} e^{ikR}}{4\pi \epsilon_0 c^3 R} \sin \theta \vec{e}_\varphi \\ \vec{E} = \frac{\ddot{p} e^{ikR}}{4\pi \epsilon_0 c^2 R} \sin \theta \vec{e}_\theta \end{cases}$$

[电偶极辐射的角分布] \vec{B} 总是横向的 (在纬线上), \vec{E} 在经面上闭合. 由 $\vec{\nabla} \cdot \vec{E} = 0$ 可知 \vec{E} 必须完全闭合, 即不可能完全横向. 电偶极辐射只在略去 $\frac{1}{R}$ 高次项后才近似为空间中的 TEM 波.

[电偶极辐射的能流] $\vec{S} = \frac{|\ddot{\vec{p}}|^2 \sin^2 \theta}{32\pi^2 \epsilon_0 c^3 R^2} \vec{e}_R$.

(1). 在 $\theta = 90^\circ$ 方向上辐射最强;

(2). 在 $\theta = 0^\circ$ 和 $\theta = 180^\circ$ (沿电偶极矩轴线) 方向没有辐射.

[电偶极辐射功率] $P = \oint |\vec{S}| R^2 d\Omega = \frac{1}{4\pi \epsilon_0} \frac{|\ddot{\vec{p}}|^2}{3c^3}$.

4. 电磁场的动量与动量守恒

[电磁场动量守恒] $\vec{f} = [\epsilon_0 (\vec{\nabla} \cdot \vec{E}) \vec{E} + \epsilon_0 (\vec{\nabla} \times \vec{E}) \times \vec{E} + \frac{1}{\mu_0} (\vec{\nabla} \cdot \vec{B}) \vec{B} + \frac{1}{\mu_0} (\vec{\nabla} \times \vec{B}) \times \vec{B}] - \epsilon_0 \frac{\partial}{\partial t} (\vec{E} \times \vec{B})$.

[电磁场动量守恒推导]

由 $\vec{f} = \rho \vec{E} + \vec{J} \times \vec{B}$ 和 $\vec{\nabla} \cdot \vec{E} = \frac{\rho}{\epsilon_0}$ 得 $\vec{f} = \epsilon_0 (\vec{\nabla} \cdot \vec{E}) \vec{E} + \vec{J} \times \vec{B}$

由 $\vec{\nabla} \times \vec{B} = \mu_0 \vec{J} + \mu_0 \epsilon_0 \frac{\partial \vec{E}}{\partial t}$ 得 $\vec{f} = \epsilon_0 (\vec{\nabla} \cdot \vec{E}) \vec{E} + \frac{1}{\mu_0} (\vec{\nabla} \times \vec{B}) \times \vec{B} - \epsilon_0 \frac{\partial \vec{E}}{\partial t} \times \vec{B}$

由 $\vec{\nabla} \cdot \vec{B} = 0$ 得 $\vec{f} = \epsilon_0 (\vec{\nabla} \cdot \vec{E}) \vec{E} + \frac{1}{\mu_0} (\vec{\nabla} \cdot \vec{B}) \vec{B} + \frac{1}{\mu_0} (\vec{\nabla} \times \vec{B}) \times \vec{B} - \epsilon_0 \frac{\partial \vec{E}}{\partial t} \times \vec{B}$

由 $\frac{\partial}{\partial t} (\vec{E} \times \vec{B}) = \frac{\partial \vec{E}}{\partial t} \times \vec{B} + \vec{E} \times \frac{\partial \vec{B}}{\partial t}$ 得 $\epsilon_0 \frac{\partial \vec{E}}{\partial t} \times \vec{B} = \epsilon_0 \frac{\partial}{\partial t} (\vec{E} \times \vec{B}) - \epsilon_0 \vec{E} \times \frac{\partial \vec{B}}{\partial t}$

由 $\vec{\nabla} \times \vec{E} = -\frac{\partial \vec{B}}{\partial t}$ 得 $\epsilon_0 \frac{\partial \vec{E}}{\partial t} \times \vec{B} = \epsilon_0 \frac{\partial}{\partial t} (\vec{E} \times \vec{B}) - \epsilon_0 (\vec{\nabla} \times \vec{E}) \times \vec{E}$

综上所述, $\vec{f} = [\epsilon_0 (\vec{\nabla} \cdot \vec{E}) \vec{E} + \epsilon_0 (\vec{\nabla} \times \vec{E}) \times \vec{E} + \frac{1}{\mu_0} (\vec{\nabla} \cdot \vec{B}) \vec{B} + \frac{1}{\mu_0} (\vec{\nabla} \times \vec{B}) \times \vec{B}] - \epsilon_0 \frac{\partial}{\partial t} (\vec{E} \times \vec{B})$.

$$[\text{电磁场的动量密度}] \quad \vec{g} = \varepsilon_0 \vec{E} \times \vec{B} = \frac{1}{c^2} \vec{S}.$$

5. 天线的辐射

$$[\text{短天线的辐射功率}] \quad P = \frac{\pi I_0^2}{12} \sqrt{\frac{\mu_0}{\varepsilon_0}} \left(\frac{l}{\lambda} \right)^2.$$

设天线长为 l , 中心馈电点电流最大且为 I_0 , 在两端点电流为 0.

短天线满足 $l << \lambda$, 天线上的电流分布近似线性: $I(z) = (1 - \frac{2}{l}|z|) I_0$, ($|z| \leq \frac{1}{2}l$).

$$\text{由 } \dot{\vec{p}} = \int_V \vec{J} dV' \text{ 得 } \dot{\vec{p}} = \int_{-\frac{1}{2}l}^{\frac{1}{2}l} I(z) dz = \frac{1}{2} I_0 l \vec{l}$$

$$\text{短天线的辐射功率 } P = \frac{|\ddot{\vec{p}}|^2}{4\pi\varepsilon_0 c^3} \frac{1}{c^3} = \frac{\pi I_0^2}{12} \sqrt{\frac{\mu_0}{\varepsilon_0}} \left(\frac{l}{\lambda} \right)^2.$$

$$[\text{短天线辐射电阻}] \quad R_r = \frac{\pi}{6} \sqrt{\frac{\mu_0}{\varepsilon_0}} \left(\frac{l}{\lambda} \right)^2, \quad (l << \lambda).$$

[长线天线的矢势]

由 $\vec{\nabla} \cdot \vec{A} + \frac{1}{c^2} \frac{\partial \varphi}{\partial t}$ 和 $\vec{E} = -\vec{\nabla} \varphi - \frac{\partial \vec{A}}{\partial t}$, 且长线天线电流只沿 z 方向, \vec{A} 也只沿 z 方向.

$$\text{由 } \begin{cases} \frac{\partial A_z}{\partial z} + \frac{1}{c^2} \frac{\partial \varphi}{\partial t} = 0 \\ E_z = -\frac{\partial \varphi}{\partial z} - \frac{\partial A_z}{\partial t} \end{cases} \quad \text{得 } \frac{1}{c^2} \frac{\partial E_z}{\partial t} = \frac{\partial^2 A_z}{\partial z^2} - \frac{1}{c^2} \frac{\partial^2 A_z}{\partial t^2}$$

在天线表面切向方向上 $E_z = 0$, 所以 $\frac{\partial^2 A_z}{\partial z^2} - \frac{1}{c^2} \frac{\partial^2 A_z}{\partial t^2} = 0$

$$\vec{A} \text{ 满足推迟势 } \vec{A}(\vec{x}) = \frac{\mu_0}{4\pi} \int_V \frac{\vec{J}(\vec{x}') e^{ikr}}{r} dV'.$$

$$[\text{半波天线的矢势}] \quad \vec{A}(\vec{x}) = \frac{\mu_0 I_0 e^{ikR}}{2\pi k R} \frac{\cos\left(\frac{\pi}{2} \cos\theta\right)}{\sin^2\theta} \vec{e}_z.$$

$$[\text{半波天线的场}] \quad \begin{cases} \vec{B}(\vec{x}) = -i \frac{\mu_0 I_0 e^{ikR}}{2\pi R} \frac{\cos\left(\frac{\pi}{2} \cos\theta\right)}{\sin\theta} \vec{e}_\varphi \\ \vec{E}(\vec{x}) = c \vec{B} \times \vec{e}_R = -i \frac{\mu_0 c I_0 e^{ikR}}{2\pi R} \frac{\cos\left(\frac{\pi}{2} \cos\theta\right)}{\sin\theta} \vec{e}_\theta \end{cases}$$

$$[\text{半波天线的辐射能流密度}] \quad \bar{S} = \frac{\mu_0 c I_0^2}{8\pi^2 R^2} \frac{\cos^2\left(\frac{\pi}{2} \cos\theta\right)}{\sin^2\theta} \vec{e}_R.$$

辐射角由分布因子 $\frac{\cos^2\left(\frac{\pi}{2} \cos\theta\right)}{\sin^2\theta}$ 确定, 与偶极辐射角分布相似, 但较集中于 $\theta = 90^\circ$ 平面上.

【半波天线总辐射功率】 $P = \frac{\mu_0 c I_0^2}{8\pi} [\ln(2\pi\gamma) - Ci(2\pi)]$, 其中: 欧拉常数 $\ln(\gamma) \approx 0.577$, 积分余弦函数 $Ci(x) = -\int_x^\infty \frac{\cos t}{t} dt$. $P \approx 2.44 \frac{\mu_0 c I_0^2}{8\pi}$.

$$[\text{半波天线的辐射电阻}] \quad R_r \approx \frac{\mu_0 c}{4\pi} \times 2.44 \approx 73.2\Omega$$
